

OEC
(accessory)

OEC OLSBERG EFFICIENCY CONTROLLER

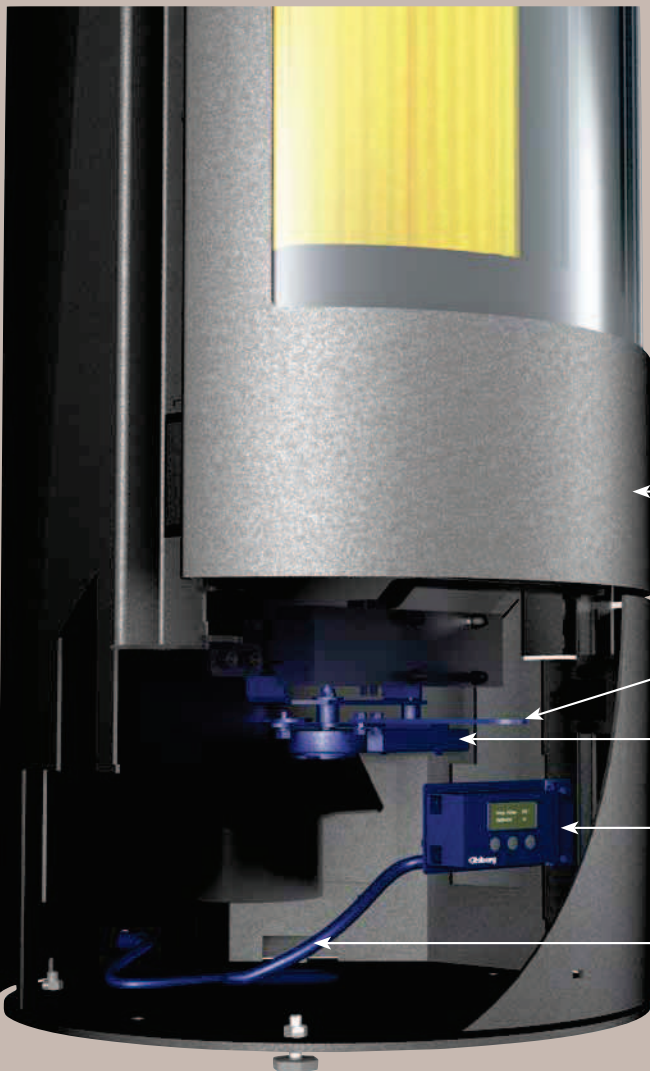

- Maximum comfort at low cost

Optimised combustion process through:

- Heating gas-controlled combustion regulation
- Optimum combustion air supply
- Low-pollution combustion
- No cooling of the surrounding area after burnout
- Simple conversion to manual operation
- Simple to upgrade

The temperature of the waste gas is controlled with a sensor. The data gathered is passed on to a processor in the regulation unit which compares it with the ideal conditions saved in the appliance. With the help of an actuator, the quantity of combustion air is

optimally regulated in line with every combustion situation. In the burnout when the embers are glowing, the OEC closes the air supply and thus prevents the surrounding area from cooling down.
